

Evaluation of a Julia Control Toolbox

Martin Karlsson

Dept. of Automatic Control
Lund University

Introduction

- `Control.jl` (first hit on google; julia control toolbox)
- Julia 0.4 is required
- No documentation yet, but exported functions have docstrings
- Appears similar to other control systems design toolboxes, e.g. Control Systems Toolbox in Matlab.
 - Systems stored as transfer functions or state-space representations
 - Evaluation in both time and frequency domain
 - Stability and performance properties
- My approach: Evaluation of functionality, rather than stress test

Contents

- 1 Systems: Transfer functions and state-space representations
- 2 Basic analysis: poles, zeros, gain etc.
- 3 Frequency domain: Bode and Nyquist diagrams
- 4 Time domain: step response etc.
- 5 Controller synthesis
- 6 Comparison with toolbox in Matlab

Transfer functions

```
G = tf([1],[1, 2, 1])
```

```
TransferFunction:
```

$$\frac{1.0}{s^2 + 2.0s + 1.0}$$

```
pole(G)
```

```
-1  
-1
```

```
tzero(G)
```

```
0-element Array{Float64,1}
```

```
gain(G)
```

```
1.0
```

State-space

```
Gss = convert(StateSpace, G)
```

```
StateSpace:
```

```
A =
```

	x1	x2
x1	-2.0	-1.0
x2	1.0	0.0

```
B =
```

	u1
x1	1.0
x2	0.0

```
C =
```

	x1	x2
y1	0.0	1.0

```
D =
```

	u1
y1	0.0

Continuous-time state-space model

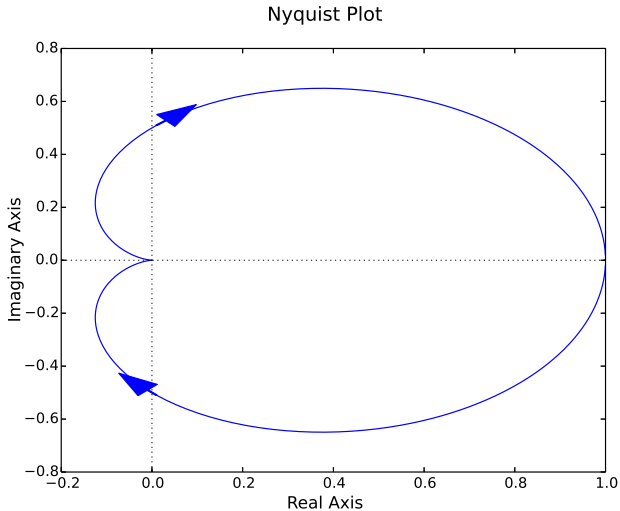

Bode diagram

bodeplot (G)

Nyquist diagram

`nyquistplot(G)`

Step response

stepplot(G)

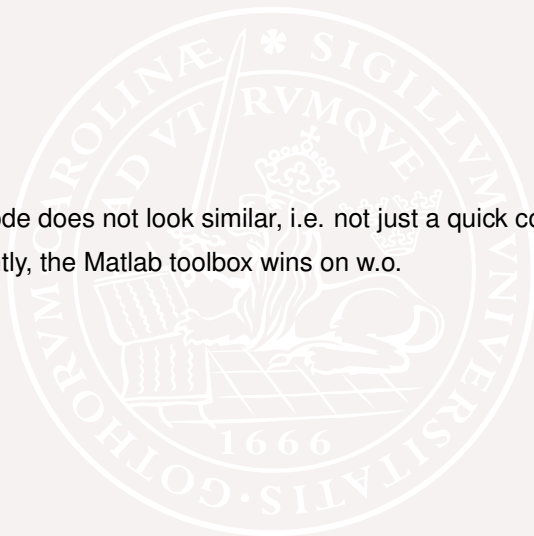

Impulse response

```
impzplot(G)
```

Comparison with the Matlab toolbox

- The code does not look similar, i.e. not just a quick conversion
- Currently, the Matlab toolbox wins on w.o.

Conclusion

- Looks promising, but runs on an unstable version of Julia
- Only the basics worked without modification
- Difficult to evaluate the more advanced functionality

Assignment for next seminar- very optional

- Get the control toolbox
- Define a system of particular interest, either as a tf or ss
- Analyse your system. Generate Bode and Nyquist plots, evaluate the stability etc.
- And the final grade is...

Final grade
